

1. Write a blog difference between window and document objects

<u>WINDOW OBJECT</u>	<u>DOCUMENT OBJECT</u>
<ul style="list-style-type: none">• It is the top most object and outermost element of the object hierarchy .• It represents a window/tab containing a DOM document where as <i>document object</i> is property of <i>window object</i> that points to the DOM document loaded in that window.	<ul style="list-style-type: none">• Each HTML document that gets loaded into a window becomes a document object.• Can access a document object either using <i>window.document</i> property or using document object directly as window is global object.
